JINOO精诺

孔加工刀具

Professional Tool Manufacturer

刀具专业制造商

常州精诺工具制造有限公司
Changzhou Jingnuo Tools Co., Ltd.

JINOO精诺

常州精诺工具制造有限公司成立于2006年，主要从事铣刀、钻头、铰刀、非标类刀具等不同碳化钨钢切削工具的生产与销售。所销售的产品广泛应用于汽车、摩托车发动机、机械、电子、医疗和模具等各大行业领域。

公司已建立先进的“WALTER”CNC刀具研磨机械设备成型体系，以便客户更精密的刀具需求。

Changzhou Jingnuo Tools Co., Ltd. was established in 2006. It is mainly engaged in the production and sales of different tungsten carbide cutting tools, such as milling cutters, drills, reamers, and non-standard tools. The products sold are widely used in major industries, such as automobiles, motorcycle engines, machinery, electronics, medical treatment and molds.

We built up the fabrication facilities by“WALTER”CNC Grinding Machines which supports us for more precision products to customers.

See P18-23 for specifications

See P24-29 for specifications

New universal series twist drill

2200 range

Universal Series Upgrade

- Suitable for steel parts, cast iron, stainless steel, non-ferrous metal processing
- New J-style groove design, curved edge, double plane back angle
- Wave-shaped cutting edge design of the drill tip, taking into account the strength and sharpness of the cutting edge, effectively reducing cutting resistance.
- lit. short cross-bladed blade, good for centering
- High feed rate and high productivity can be realized.

Twist drills for stainless steel

2600 range

Specialized for stainless steel and hard-to-cut materials

- Independently developed new series of drills for stainless steel, heat-resistant alloys, titanium alloys, etc.
- New extra-large G-type groove design, with excellent measuring space and discharge performance.
- Unique tip design for better chipping performance.
- New blade material and coating for greater toughness and corrosion resistance

2100Series Universal Machining Twist Drill

- HELICA protective layer Curved Edge, Sharpened Back Angle
- Curved Edge, Sharpened Back Angle
- Applicable materials: steel, cast iron, etc

For specification details, seeP12-17

2300Series Plain steel machining twist drills

- A ITiN-nano coating Straight edge, flat back angle
- A pplicable materials: steel, cast iron, etc.
- **New ATN-n8no coating for excellent tool wear resistance**

For specification details, seeP30-42

For specification details, seeP50-52

2500Series Twist Drill for Aluminum Alloy

- **Suitable for aluminum and copper.**
- **X-shaped drill tip design with excellent self-centering function**

For specification details, seeP43-49

3000Series Deep Hole Drilling

- **For efficient drilling of steel, cast iron and stainless steel.**
- **New base material, perfect balance of toughness and abrasion resistance**
- **U se of ATTN-based nano-coatings and unique post-coating treatments**
- **O ptimized groove and drill tip design, strong self-centering performance and corrosion breakage and discharge performance.**

7200Series Straight Groove Drill

- **Straight groove design, suitable for cast iron, aluminum alloy machining**
- **Four-flute design improves hole wall quality and hole accuracy.**
- **X-shape drill tip, excellent self-centering performance.**

For specification details, seeP55-56

9100Series NC Center Drill

- **Suitable for center drilling and chamfering on CNC machine tools**
- **Suitable for steel, cast iron, aluminum alloy, copper alloy machining**

For specification details, seeP57

unit(mm)

D2200Series-3D Straight Shank Twist Drill

HELICA 3D

New wave-shaped edge design, taking into account both edge strength and sharpness, effectively reducing cutting resistance; new G-type groove design, enhanced cutting performance and cutting space;
Curved edge, flat back angle
Applicable materials: steel, cast iron, etc.

D2200Series-3D Straight Shank Twist Drill

HELICA 5D

The new wave edge design combines edge strength and sharpness to effectively reduce cutting resistance; the new G-shaped groove design enhances cutting performance and cutting space;
HELICA coating Curved edge, flat back angle.
Applicable materials: steel, cast iron, etc.

Drill Failure Analysis

	impunity	Possible causes		countermeasures
		our customers	driller itself	
Drill Failure Analysis	cumulative chipped tumour	Cutting speed too low		Selection of reasonable cutting parameters
		Inadequate cooling and lubrication		Internal cooling to increase the oil content of the coolant.
			Cutting edge not sharp	Correct resharpening
			uncoated	Selection of coated drill bits
	crushing blade	Feed too fast		Selection of reasonable cutting parameters
		Cutting speed too low		Selection of reasonable cutting parameters
			The rear corner is small	Correct resharpening
			Improper selection, cross blade	Correct choice. Strengthen the crossbar.
			Inappropriate drill material	Replacement of drill material
	point of a sword 	High tip runout creates single-edge cuts		Improved system rigidity, drill tip runout <0.02
		High cutting speed		Selection of reasonable cutting parameters
		Insufficient cooling		Adoption of internal cooling, adjustment of external cooling direction
	main blade (of blade)	Unstable drilling process		Improved system rigidity, drill tip runout <0.02
		End of life, overused		Correctly set resharpening intervals
			Inadequate selection, main blade	Correct selection, strengthen the main blade
	Abnormal tip wear 	End of life, overused		Correctly set resharpening intervals
		Drill tip not coinciding with spindle centre (lathe)		Corrective spindles
		High cutting speed		Reduced feed
		Inappropriate type of cutting fluid		Replacement of cutting fluid
			Improperly shaped blade	Selection of suitable blade shape
			Inappropriate drill material	Replacement of drill material
	chipped edge	Unstable drilling process		Improved system rigidity, drill tip runout <0.02
		High cutting speed		Selection of reasonable cutting parameters
		Insufficient cooling		Adoption of internal cooling, adjustment of external cooling direction
		Guide bush oversize, pre-drilled holes oversize		Checking and replacing suitable guide bushings, checking for large pre-drilled outer diameters
			Improper selection, too wide edges	Correct selection, reduce edges
			Improper selection, too small a prismatic chamfer	Correct selection, larger inverted cone
	Cutting Wrap	Cutting too long, cutting stagnation		Change of cutting parameters and drill re-selection
	Abnormal vibration sound		the back angle is too big	Correct resharpening
			Insufficient rigidity of the drill	Improve rigidity by choosing the right drill bit and adjusting the flute or helix angle.
	broken knife	rammer		Reduced operational errors
		Excessive feed, low cutting speeds		Selection of reasonable cutting parameters
		End of life, overused		Correctly set resharpening intervals
		Clogged chip conveyor		Selection of the right drill bit, adjustment of the flute or helix angle, optimisation of the feed parameters, pecking, improved cooling.
			It's not good to eat knives.	Improvement of tool rigidity, mention of workpiece mounting rigidity, pre-drilling of centre holes, pre-drilling of holes, use of guide bushings for drills
			The rear corner is small	Resurfacing correction
			Improper selection	Correct Selection
			Torn edges, hanging chippings leading to tangles	Timely grinding to avoid chipping of edges

Drill Failure Analysis

	impunity	Possible causes		countermeasures
		our customers	driller itself	
out of specific ation	heavy load		Improper selection, large core thickness	Reduce core thickness by correct selection
			Improper selection, improper edge treatment	Sharper edge with the right selection
	hole is too small	Unstable drilling process, poor straightness of hole slant, failure to pass gauge		Improved system rigidity, drill tip runout <0.02, improved workpiece support
		Feed too fast, hole slant		Reduced feed
	the hole is too big	Unstable drilling process and poor mounting of parts		Improvement of system rigidity, selection of good quality shanks, pre-drilling of centre holes, pre-drilling of holes.
		Low precision of spindle shank connection, high tool tip runout.		Machining of the draft surface to a flat surface, requiring a tip runout of <0.02 per clamping.
			Eccentricity of the cross blade, asymmetry of the main edge, large difference in edge heights	Correct manufacturing and resharpening
			Large tolerance on drill diameter	Reduced drill diameter
	Poor hole position accuracy 	Poorly clamped drills, high runout of the spindle itself		Choose a good quality shank, straighten the spindle, and require a drill tip runout of <0.02 per clamping.
		Deviation in tool eating		Improvement of system rigidity, use of good draft drills, pre-drilling of centre holes, pre-drilling of holes, machining of draft surfaces into flat surfaces, use of guide bushings for drills.
	Poor straightness or perpendicularity of holes 	High tool wear		Sharpening Drill Bits
		Poor accuracy of centre hole		Improved positional accuracy of centre holes
		lit. eating knife noodles is not flat		Pre-drilling of the centre hole, machining of the draft surface into a flat surface, use of a guide bush for the drill bit
			Asymmetric sharpness angle, high edge height difference, eccentricity of transverse edge	Resharpening the drill
			Insufficient rigidity of the drill	Improvement of drill rigidity
	Poor surface quality	Low precision of spindle shank connection and high drill tip runout.		Improved system rigidity, drill tip runout <0.02
		Insufficient cooling		Adoption of internal cooling, adjustment of external cooling direction
		Inadequate lubrication		Increase the oil content of the coolant, or increase the flow rate.
		Feed too fast		Reduced feed
		Cutting Wrap		timely sharpening
			Chopping blockage	Reselecting the drill, adjusting the flute or helix angle, optimising the machining parameters
			Severe sticking on the edge of the belt prism	Selection of coated drill bits
			Improper selection, uncoated	Correct selection, drill coating

caveat：

1.Please use a machine with good rigidity. Hydraulic toolholders, heat-shrinkable toolholders, and precision strong spring toolholders are recommended.;

2.The tool should be mounted in such a way that the radial runout of the drill tip is less than 0.02mm;

3.this standard cutting condition is applicable to water-soluble cutting fluid;

4.for tool specifications not in this table, please refer to the closest cutting edge diameter specifications to select cutting parameters, and also adjust the cutting parameters appropriately according to the broken pin and spindle load;

Cutting speed Vc and feed per revolution fn can be adjusted within ±20% depending on working conditions.

Recommended Cutting Capacity: D2200 Series Twist Drill for Steel

Cutting speed Vc and feed per revolution fn can be adjusted within ±20% depending on working conditions.

Calculation of drilling parameters

Cutting speed Vc (m/min)

$$V_c = \frac{D_c \times \pi \times n}{1000}$$

Spindle speed n (rpm)

$$n = \frac{V_c \times 1000}{\pi \times D_c}$$

Feed per revolution fn (mm/r)

$$f_n = \frac{V_f}{n}$$

Feed rate Vf (m/min)

$$V_f = f_n \times n$$

Metal removal rate Q (cm^3/min)

$$Q = \frac{D_c \times f_n \times V_c}{4}$$

Processing time Tc (min)

$$T_c = \frac{l_m}{V_f}$$

formula:

Dc Drill Diameter (mm) Vc cutting speed (m/min)

n Spindle speed (rpm) fn Feed per revolution(mm/rev)

Vf Feed rate(mm/min) Q lm Drilling depth (mm)

Metal removal rate(cm^3/min) π Tc processing time (min)

a constant (math.)=3.1415

example：D2605–CHA–D10

D2600 Twist drill for stainless steel

05 – The depth of cut is 5xDc 5 doubled blade diameter (e.g. of a knife blade)

C – internal cold HA–DIN6535HA straight handle

D10– 钻头刃径 Dc=10

Machining austenitic stainless steel with this drill, from the cutting table to find the recommended cutting amount: Cutting speedVc=80 m/min Feed per revolutionfn=0.21 mm/rev

Drilling depth lm In this case5xDc=5x10=50 mm 。

Calculations: speed n, feed rate Vf, metal removal rate Q and time to machine a hole Tc 1 Speed n.

n =Vcx1000/π/Dc=80x1000/3.1415/10=2547 (rpm)

2 Feed rateVf:

Vf=fnxn=0.21x2547=535 (mm/min)

3 Metal removal rateQ:

Q=DcxfnxVc/4=10x0.21x80/4=42 (cm^3/min)

4 Time to machine a holeTc： Tc=lm/Vf=50/535=0.093 (min)
